The DataMelt software can be used as a development and computation environment. The tool can be used in Jython, Groovy, JRuby/Ruby and BeanShell programming languages. You may open new projects in various templates, including jHPlot script, text document, Java application and Java applet. The supported script formats include Jython (*.py), Groovy (*.groovy, *.gvy, *.gy), or JRuby (*.rb). You may load a script from an external file, or from a URL; the supported script formats include Jython (*.py), Groovy (*.groovy, *.gvy, *.gy), or JRuby (*.rb). You may save the files after performing all the modifications, in the specific format or automatically compress them in a *.zip container. You may also compile data visualization charts or graphs, as HPlot, HPlot 3D, HPlotJA canvases, 2D Function Views or 3D surfaces. The tool includes several examples designed to reflect the functions you can perform and the results you can obtain. Moreover, DataMelt allows you to load and save specific diagrams, such as: 3D vector graphics, including Jython graphics package (JPEG, PNG, GIF) and jMathLab (*.jpg, *.jpeg, *.png, *.gif) graphs. Additionally, you may compile your graphic into a high-quality vector format (EPS, PDF, SVG, PS) and save them as a Java object or text file. ... Neta is a powerful software to analyse,visualise and modify large datasets in real-time. The user friendly interface will allow you to perform the analysis of huge datasets in a matter of minutes. This software is especially designed to handle multiple projects and data. The use of huge amounts of data can be handled with ease with Neta thanks to its ability to recognise the format of the file being analysed. Neta can read and organise the data being analysed, so that the user can quickly get a view of the data being analysed. The use of Neta will increase your effectiveness in analysing multiple project of this scale and time saving in analysis. Neta can be used to create bar, line or pie charts from data organised into a Datatable. Neta can also be used to create plots from data organised into a Datatable. Neta also allows for you to modify data for the purpose of analysis. Neta can also be used to access almost any kind of file

The developers have created a simple, yet powerful, and flexible software library for Java. It can be used to represent concepts from many different branches of science. Most notably, it is used in physics, bioinformatics, and mathematics. The project includes a set of classes that define and manage spatial concepts. Also, it provides interfaces that allow for a more streamlined programming model and access to a few related Java classes. The project provides a comprehensive set of geometrical primitives that can be used to represent spatial concepts, such as lines, curves, areas, volumes, and regions. The spatial primitives and interfaces are represented using the Affine, Euclidean, and Vorpal representations. The software includes a Java API that can be used to represent concepts of graphics. Its primary focus is on drawing regions, lines, curves, and points, using the concepts of Affine, Euclidean, and Vorpal representations. Additionally, the class manager manages coordinate systems.

Octave is a powerful numerical programming language and environment. The current release supports Linux, Windows, and Mac operating systems. It is an open source, integrated development environment (IDE) for numerical computing, feature-rich numerical and symbolic mathematics, and for fast scripting. Its main features include:
