I have a model called Company in a Rails app. I have an external library which uses Companies (i.e. Company.all). The external library returns an error when accessing a Company record. The error is something like "Couldn't find with 'id'=1". How do I get the error to be interpreted in my Rails app so I can deal with it appropriately? A: Rails 3.1 introduces more safety and functionality in ActiveRecord: "Couldn't find" is a very generic exception, it can easily mean that you are not using right query. What kind of query are you trying to use? And then, when you make that query, what is the error you're getting? Is it an SQL error, or maybe an ActiveRecord error? I'd suggest doing something like this: Company.where(field: "value").first (Of course, it will depend on what you're trying to do. For example, if you're trying to find a single Company, and you receive that error, it's more likely that it's a SQL error, and not an ActiveRecord error. That code would look like this: Company.where(field: "value").first You can also use the older find() method, in which case you will get ActiveRecord exceptions, and you need to handle those errors differently. 2nd One 2nd One, Inc. was a start-up company based in Mountain View, California that was launched in 2005 as a spin-off of OnLive. It was one of the first video game distribution companies to successfully enter the console market. 2nd One released games on Sony, Nintendo, and Microsoft consoles. They also created a platform that was released on both the PC and the Xbox 360 called 2nd One Access. History
